

## ALL IN ONE CONCEPT

Optimal results in record time!

In 2 - maximum 3 sessions to the final prosthetic restoration - even for large complete restorations.

In the first session or sequence, all dental problems are eliminated at once. This is because only when all potential interference factors such as metals, osteonecrosis, root-treated teeth and other interference fields are completely removed is the immune system able to do a perfect job and reliably heal the implants and eliminate system stress. This is even more important because ceramic implants are completely neutral and therefore only heal in healthy bone with a functioning immune system.

In the second session, the final prosthetic restoration is made, which is very similar to restoring natural teeth.

On the reverse side you can see an example of the treatment procedure.
