Dental Ozone Therapy for Patients

HOW DOES DENTAL OZONE THERAPY WORK?

Ozone, which also occurs in nature, is a super oxygen. In medical ozone therapy, ozone is produced in a special treatment device.

When it comes out of the device, ozone decays rapidly. In this decay process, microorganisms in close proximity are killed. The ozone is therefore applied directly to the affected areas using a fine probe.

WHAT ADVANTAGES DOES OZONE TREATMENT OFFER YOU?

Ozone unfolds its effective power even in the finest niches and grooves, root canals and gingival pockets. All bacteria, viruses and fungi are practically completely eliminated. The treatment is free of side effects. There are no known allergic reactions.

- Ozone disinfects reliably
- Ozone fights fungi, bacteria and viruses
- Ozone helps stop bleeding
- Ozone relieves pain
- Ozone positively supports the healing process

THE VERSATILITY & EFFECTIVENESS OF DENTAL OZONE THERAPY

Implants

Local ozone therapy has proven to be very effective in the insertion of implants. The reliable elimination of germs of all kinds has a positive effect on the subsequent healing process, as many years of practical experience have shown.

Caries

Local ozone therapy supports the treatment of caries. It eliminates germs even in the finest grooves of the chewing surface of a tooth. In the case of superficial caries, drilling becomes unnecessary in many cases. Even if drilling is necessary, ozone treatment can protect the tooth from new caries forming in the long term.

Gingivitis and periodontitis

In cases of gum disease, ozone treatment provides a very valuable service. Even germs in deep gum pockets, which can attack and destroy the gum structure, are quickly eliminated. Periodontal therapy is effectively supported more quickly.

Hypersensitivity

Dental ozone therapy is also successfully used against painful hypersensitivity of teeth to sweets, sour, hot or cold.

Removable dentures

Local ozone therapy provides immediate relief from problems often associated with dentures: E.g. pressure sores and candidamycosis (thrush).

Aphthae, herpes and fungal diseases

Ozone eliminates the causative germs. Local application to the affected areas relieves discomfort immediately and contributes significantly to the rapid abatement of aphthae, herpes and fungal diseases.

Further applications in dentistry

- Before, during and after surgical interventions
- For wound treatment in general
- Generally for inflammation treatment and prevention of further damage
